11 - Year experience in Type 1 Thyroplasty for unilateral vocal fold paralysis

Dr Arthur Jones¹, Dr Justine Millar¹, Dr Julia Maclean², Dr Ian Cole¹¹*Department of ENT, Sutherland Hospital, SESLHD, NSW, Australia*²*Department of Speech Pathology, St George Hospital, SESLHD, NSW, Australia*

Unilateral vocal fold paresis can have a significant impact on quality of life due to glottic insufficiency which can result in dysphonia, aphonia, dyspnoea, decreased cough strength, and dysphagia. Our institution runs a dedicated voice clinic in close partnership with specialist speech pathology which allows a multidisciplinary approach to patient care. For those that fail diet modification and conservative measures, various medialisation procedures are available including filler injection and type 1 thyroplasty with or without arytenoidopexy. We performed a retrospective review of all patients who underwent type 1 thyroplasty at our institution over the last 11 years. We present our experience and outcomes with type 1 thyroplasty performed at our institution over the past 11 years.
