

## Non-laser tattoo removal for the 21<sup>st</sup> century

**Mary Arnold-Ronish**  
Tattoo Vanish Inc., USA

The most common method of removing a tattoo is through a laser of one type or another. I am here to tell you that laser tattoo removal is still back in the 20<sup>th</sup> century. It is now time for a new and much improved method of removing ink from the skin. How you like to be able to remove tattoos of any color, anywhere on the body, in 50% to 75% less treatments than laser. What about all of that excreting pain lasers cause? Wouldn't it be wonderful to be able to remove all ink of any color in three to five treatments with less pain than when they received the tattoo? How great would it be if we could pull all of the ink out of the skin, instead of dispersing ink throughout the body, as lasers do? Lasers put the ink into the lymphatic system for possibly the entire life of the patient. We do not know what kind of damage that ink in the body can do, but I have my own ideas. As a bonus, how would you like for this new process and product to be completely natural and no acid or any other harmful ingredient in it. All natural, non-laser, no acid, just a natural product and process that is taking the tattoo removal industry by storm is presented. Statistics show tattoo removal to be a faster growing industry that getting inked. I hope to tell you more.

### Biography

Mary Arnold-Ronish, a retire RN, with over 3 years in Nursing has been involved in the field of medical and cosmetic tattooing since 1992. She spent 20 years in the field of surgical dermatology. She is the developer of this innovative method of removing tattoos using a completely all natural, no acid, non laser process and product of removing ink.
