The use of neuro-modulators with attention to facial expressions

Kamal T Sawan

Sawan Surgical Aesthetics, USA

The use of neuro-modulators like botox is the most popular non-surgical method to enhance facial features and reduce wrinkles along the forehead and glabella. The use has been extended to other areas in the face and neck partly to reduce wrinkles and fine lines or to obtain desired secondary effect from action on certain muscles of facial expression. A good understanding of muscles of facial expression at rest and during animation (static and dynamic) is crucial to obtain the best results possible. In this presentation, we will address how to obtain best results with attention to facial expression and doses of neuromodulators.

The use of tissue expansion in the treatment of scars and scar alopecia of the scalp

Saleh S Kadhim

Dubai Medical College, UAE

Tissue expansion is a modality, whereby tissue is expanded through a period of time to attain certain size and can be used to replace a tissue in a nearby area and contain the same color and texture of that area. Tissue expansion is an excellent modality of treatment for scar alopecia of the scalp and other scar area in the body, giant navai of the body and certain other conditions. This tissue expansion has very good result in head, neck, breast area and limited use of the lower half of the body.
