Aesthetically restore eyebrows by follicular unit extraction

Zhi-qi Hu, Yong Miao, Zhe-Xiang Fan and Wei Jiang
Nan Fang Hospital, China

Many factors can cause the sparse or absent of eyebrows. Eyebrow transplantation is a unique skill among hair transplant surgeons. To restore a natural-looking eyebrow, finer hair grafts close to the hairline serve as an ideal donor. Use of follicular unit extraction (FUE) to harvest hair located close to the hairline margins can overcome some of the problems associated with strip harvesting and result in more control over eyebrow softness aesthetics. In the current study, finer single hair follicles located close to the hairline margins of the peri-auricular area by the FUE method were used to restore eyebrows and good results were achieved.

Biography

Zhi-qi Hu has completed his PhD from Sun Yat-sen Medical University. He is the Director of Plastic and Aesthetic Surgery Department of Nan Fang Hospital, an affiliated hospital of Southern Medical University. He has published more than 15 papers on hair medication in reputed journals.
