July 21-23, 2014 Hampton Inn Tropicana, Las Vegas, USA

## Face remodeling with volumizing filler

Hussein Ahmed  
Kaya Skin Clinic, UAE

**Introduction:** It has been shown that loss of fat in specific compartments of the face is one aspect that contributes to facial aging. One technique to inject facial filler is to fill a specific line. This is most commonly done to fill the naso-labial lines. While this may give some results, other injection modalities were done to achieve better results.

**Aim of the work:** Injection of the specific facial fat compartments that have lost volume with volumizing filler.

**Patients:** 10 patients who attend the clinic for anti age service with loss of volume due to aging, or patients who lost face volume after considerable weight loss.

**Results:** Injection of the volumizing filler to replace volume loss can markedly improve face contour and restore younger looking.

## Biography

Hussein Ahmed has completed his MD at the age of 24 years from Suez Canal University, Egypt and got his master Degree in Dermatology and Veneorology in 2003.
