²Mersin State Hospital

Chronic leg ulcers are open sores which are caused by an injury or an underlying disease such as diabetes, vascular pathology or rheumatoid arthritis. In this study ten patients with chronic leg ulcers which are due to variable diseases were treated with intralesional vitamin c. Vitamin c was injected to ulcers as 10-mm intervals once a week. During the study in all ulcerative lesions were regressed. We suggest that vitamin c injection may be an important part of treatment in chronic leg ulcers.

Biography

Ufuk Kavuzlu received his medical degree from Mersin University in 2011, at the age of 24. Since 2013 he is an assistant doctor in Mersin University Hospital which his ongoing residency training in dermatology has started in.
