

International Conference and Expo on

Cataract and Optometrists Meeting

August 04-05, 2016 Manchester, UK

Can we reach a safe land with these cases?

Ashraf Armia Balamoun

Al Watany Eye Hospital, Egypt

Two videos presents about challenge cases in cataract surgeries. The First one was male patient 15 years old with history of right eye blunt trauma since 7 years. He developed severe ocular inflammation following the trauma ending by formation of white patchy membrane on the iris and the anterior surface of the lens with 2 points of PAS. Complicated white cataract developed. Vision is HM GP GME. IOP was 16 mmHg. Retina was in place by Ultrasound. Post surgery vision improved till 6/24. The second case is a male patient 22 years old with history of blunt trauma and with traumatic cataract since 2 years. He did cataract and implantation of a three pieces posterior chamber IOL and YAG laser posterior capsulotomy was done. He came after two years asking for better vision and we found that he had a wrong calculated IOL. Surprisingly, we found that he needs a piggy bag IOL with -16 D. We did not found this power and we thought to use an ICL as a piggy bag solution. Post surgery vision improved till 6/24.

Biography

Ashraf Armia Balamoun has completed his MBChB from Cairo University of Egypt. He finished his Master's degree in Ophthalmology (MSc) from Cairo University of Egypt.
