

3rd European Food Safety & Standards Conference

October 24-25, 2016 Valencia, Spain

Analysis of food safety and food security indicators

Ekaterina Silanteva

Moscow State University, Moscow

Consumers expect that the food available on domestic markets is safe and of the expected quality. However, it is not always true. Unsustainable food chains and trade monopolization of the food market lead to weakening of the food security in the country. For improvement of human nutrition, it is crucially important to provide people with high quality food and create the diverse and sustainable food chains. Systems of food safety and quality management should support fair and transparent trade thereby contributing to economic development, improved livelihoods and food security. The appropriate food safety and security indicators should be used to analyse quality of food chains in different countries. There is a need to develop food safety and security indicators that are not being fully measured, including dietary quality and trade diversity, women's empowerment, health environments and food environments.

Biography

Ekaterina Silanteva is a Scientist from Moscow. The field of his interest includes "Competitive advantages of the companies in the food market (especially SMEs), building of sustainable food chains, food safety and security". He has completed his Specialist degree programme at School of Public Administration at Lomonosov Moscow State University and has continued his studies as PhD student.
