

## MOVPE droplets heteroepitaxial growth model

**Yossi Paltiel**  
Hebrew University, Israel

There is an increasing interest in Quantum Dot (QD) structures for various applications, including optoelectronic devices, quantum information processing and energy harvesting. Over the last years, self assembled QD's, prepared by different methods have been observed in different semiconductor systems. In the present research we grow the dots using the Droplet Hetero Epitaxial (DHE) mode. This method is potentially not limited to mismatched material systems as in other growth methods and is very attractive for the growth of binary and more complicated compounds. Although the DHE method is relatively complex, it is quite relaxed with respect to the material combinations that can be used. This offers great flexibility in the systems that can be achieved. In this work, we review the structure and composition of a number of quantum dot systems grown by the droplet heteroepitaxy method, emphasizing the insights that these experiments provide with respect to the growth process.

Detailed structural and composition information with sub-nano resolution has been obtained using both conventional nano-characterization methods with surface X-ray diffraction analyzed by the COBRA phase retrieval method. A number of interesting phenomena have been observed. These include penetration of the dots into the substrate ("nano-drilling") and interdiffusion and intermixing that already start when the group III droplets are deposited. The final dots structure and composition may be very different from the one initially intended. The recent understanding of the DHE growth dynamics can open a way to tune the confinement potential, electrical and optical properties of the final nano-structures.

### Biography

Yossi Paltiel has completed his Ph.D. in the Physics Department at the Weizmann Institute of Science, Rehovot, Israel. Following his Ph.D., he served as the head of the electro optical division in several startups. He had also a tenured position at Soreq National Laboratory, Israel working on semiconductor quantum devices. Since July 2009, he is leading the Applied Physics Department, Quantum Nano-Engineering group at the Hebrew University, and received a tenured position in January, 2013. Yossi Paltiel has published more than 60 papers and has 9 patents and patent applications. Since 2009, the group gave 22 invited talks.
