## OHSS in IVF treated patient with twin pregnancy complicated with Ovarian Torsion – A Case Presentation

**Khushbu Agrawal**  
PGIMER, India

**Summary:** A 29 yrs lady with previous history of spontaneous abortion underwent IVF due to male factor infertility. Twins pregnancy after IVF developed OHSS after 8<sup>th</sup> day of Embryo transfer. Managed conservatively with B/L Pleurocentesis developed large cysts in both the ovaries at 13<sup>th</sup> weeks of pregnancy. Ultrasound diagnosed Torsion of left ovary. The patient underwent laparotomy with intraoperative finding of torsion on left ovary with clear cyst. B/L ovarian cystectomy was done and ovarian reconstruction done. Patient had fetal demise of one twin and the pregnancy continued as singleton pregnancy.

### Biography

Khushbu Agrawal has completed her MD Postgraduate in Postgraduate Institute of Medical Education and Research (PGIMER), India. During her thesis course, she has conducted this study after seeing the tedious course of therapy, the patient had to go in the institute infertility clinic. With dedication and a hope of having some significant results with reference from the literature, she has performed this study. Currently, she is working in private hospital practicing Obstetrics and Gynecology.
