## A very rare case of skin cholesteatoma

Merih Onal, Betul Agirgol, Gultekin Ovet and Necat Alatas  
Hacettepe University, Turkey

Cholesteatoma is known as an abnormal squamous epithelial growth in the middle ear. It can erode the bony structures within the temporal bone. This pathology often encountered as cysts or pouches. It is a serious but treatable condition. Cholesteatomas should be excised surgically. Here we presented a case with an unusual location cholesteoma. 11 year old male patient was admitted to our clinic with a complaint of a mass on the helix of the auricle. The lesion was smooth and pearl white color. It was excised totally. Histopathologic diagnosis was reported as cholesteatoma. This is a very rare case of cholesteatoma seen as a skin lesion.

### Biography

Merih Onal has completed her medical education at Hacettepe University Medical Faculty and she has completed her specialist training at Hacettepe University Medical Faculty Ear Nose Throat Department on 2014. She has more than 5 publications in various journals.
