

Dentistry's treatments with hyaluronic acid for facial fillers

Simone Sattler Pinheiro
CEO, Odonto Faciale School, Brazil

Dr. Sattler is a Doctor of Dental Surgery, specialized in oral orthodontics and maxillofacial surgery. Has always studied a great deal about craniometric, cephalometrics, skeletal discrepancies and facial analysis. In modern treatment, increasingly aesthetics and function complement in order to offer always the best to the patient. Absorbable facial fillers have become an excellent option to reduce facial imperfections, whether they are thin lips, maxillary or mandibular hypotrophy, nasal labial angle below 90°, slightly prominent zygomatic, among others. These can also be used to attenuate wrinkles expression, giving a young look to the face. The dentist is a professional who has sufficient knowledge to apply these treatments and evaluate the vertical dimension, occlusion and whole facial set to give a pleasing result, within the functional pattern and, at the same time, beautiful.

Hyaluronic acid is well known to be absorbed by the body and is widely used in dermatology safely. Moreover, dentistry further aggregates this technique, enabling a more appropriate finalization of orofacial rehabilitation treatments. It promotes a broader aesthetics function as well as a patient-friendly positive feeling. The aim of the presentation will be focused in facial filling techniques and re-anatomization/reconstruction of the face even as some cases already treated.
