## CT Scan: From a scan to a crown

**Rakan Baaj**

University of Toronto, Canada

Many dentists now a days are willing to place implants. The guess work is eliminated by conducting an educated calculated guess through obtaining a CT scan and dealing with it professionally through a well thought digital flow software. In this presentation a discussion of 3D imaging background and application will be included along with a clinical implication of how to handle a CT scan and treat plan a case and be able to even fabricate/mill a future definitive crown before placing a dental implant.
