DENTISTRY AND DENTAL MEDICINE

November 22-23, 2018 Bucharest, Romania

Avoiding complications in oral implantology

Hamid Shirazi
France

Oral implantology has developed and progressed into a central core of art and science of dentistry. As our profession continues to grow, new complications continue to arise. This is understandable, as it isn't particularly enjoyable to discuss the negative consequences that occur during treatment, sometimes even despite our best efforts. The subject matter is very diverse and comprehensively encompasses all facts of implant, dentistry, diagnosis and treatment planning, surgical intervention, prosthetic rehabilitation, and the post-operative and maintenance phases of this discipline. The best way to treat complications is to "prevent" them from occurring. The five parts discuss diagnosis and treatment planning, surgical, prosthetic, periodontal and maintenance, and medico-legal aspects of dental implants. Diagnosis and treatment planning includes understanding of various types of complications. Surgical include the ideal positioning of implants in all planes along with the treatment of positioned implants. Prosthetic include a summary of fix and removable complications.

Biography

In 1994, I graduated from the faculty of dentistry in Mashhad. In 2006, I received a degree DUFPO from Rene Descartes university in Paris. In 2011, I published the translation of the book "Minor oral surgery in dental practice". I'm a scientific representative of Osstem and IML implant systems in Iran. Since 1999, I have been practicing dentistry at my personal office and my clinic. The book "Dental implant step by step" is my book ready for printing and publishing.
