Treatment of new skin diseases using a new lotion (Oronsfranklo)

Oronsaye Fe
University of Benin City, Nigeria

Background: The emergence of new diseases of unknown etiology is a common health challenge in developing countries. These diseases have defiled all known medications. They affect the upper region of the body, particularly the face, neck and the jaw.

Methods: One hundred subjects comprising 20 children, 50 adults 20 elderly subjects who were discovered having bumps 'as it is called' on the face scalp neck were randomly recruited for the study Their consent was obtained verbally.: The subjects were given the lotion oronsfranklo(R)which was applied to the affected areas twice daily, preferably morning and evening. The lotion is currently been investigated for its toxicity so that it can be recommended for systemic administration. The lotion is exclusively for external use. This lotion has been successfully used for treating both superficial fungal and bacterial infections.

Results: the most dramatic effect of the lotion is the fact that during its application, a successful clinical response was achieved within three days. Therefore, it is rightly called, the 'three days cure'.

Conclusion: This study presents, the novel effect of the lotion in Nigeria as a pre-registration requirements of the lotion. The lotion has already been registered with the ministry of commerce and industry, Nigeria as pre-registration requirement by Nafdac Nigeria before they certify any drug for commercial use. So Oronsfranklo is the trademarks assigned to this lotion by the ministry of commerce and industry Nigeria.
