

Anterior composite: Make it easy and simple

Mohamed Abdallah

Alexandria Oral Implantology Association, Egypt

Bright beautiful smiles are much in demand these days and not just among celebrities, more and more ordinary people want extra-ordinary smiles inspired by glossy magazine covers and television. When people smile fail short, they seek cosmetic dentists who often recommend porcelain restorations. Today's composite resin possesses optical characteristics that have expanded their clinical indications. The successful and predictable application of these materials depends on practitioner's understanding of their material properties as well as the clinical requirements involved in their delivery; identifying the characteristics of the natural tooth is also important.

This presentation reviews contemporary resin materials and demonstrates simple guide lines for material placement that improve the clinician's ability to implement nano-filled resins in daily practice.

Biography
