

7th Global Dentists and Pediatric Dentistry Annual Meeting

March 31- April 01, 2016 Valencia, Spain

Fellus Patrick

Robert Debre Hospital, France

From sucking to swallowing deglutition by cortical or subcortical ways

Physiological swallowing and the abandonment of the suction are essential to build a beautiful occlusion. This acquisition occurs spontaneously for 60% of children at age 4 years; sample from which recruits children who will never need orthodontic treatment. When the child requires orthodontic treatment, acquiring a good swallowing will reduce the duration of treatment and ensure the stability of the results. This change in the swallowing program can be done by cortical or sub-cortical ways. The success will not be the same.

Biography

Fellus Patrick is a Doctor at University Hospital Robert Debre. He is the President of the French Society of Pediatric orthodontics. He is an Orthodontist and a qualified expert author of three books: Rehabilitation of swallowing orthodontics, dentition dysfunction in dysmorphism contribution and froggy mouth.
