Dentistry & Oral Care

April 18-20, 2016 Dubai, UAE

Fellus Patrick

French Society of Pediatric orthodontics, France

From sucking to swallowing deglutition by cortical or subcortical ways

Physiological swallowing and the abandonment of the suction are essential to build a beautiful occlusion. This acquisition occurs spontaneously for 60% of children at age 4 years; sample from which recruits children who will Never need orthodontic treatment. When the child require orthodontic treatment, acquiring a good swallowing will reduce the duration of treatment and ensure the stability of the results. This change in the swallowing program Can be done by cortical or subcortical ways

Biography

Robert university hospital debrem President of the French Society of Pediatric orthodontics morthodontist qualified expert author of three books mrehabilitation of swallowing northodontics dentition ndysfunction in dysmorphosis contribution froggy mouth.
