December 06-07, 2018 | Rome, Italy

Anti-cancer preparation NSC-631570 (UKRAIN) in the treatment of malignant melanoma and xeroderma pigmentosumWassil Nowicky^{1,2} and Larysa Skivka³¹Nowicky Pharma, Austria²Ukrainian Anti-Cancer Institute, Austria³Taras Shevchenko National University of Kyiv, Ukraine

Xeroderma pigmentosum (XP) is a genetic disorder of DNA repair in which the ability to repair damage caused by ultraviolet (UV) light is deficient. Multiple basal cell carcinomas (basaliomas) and other skin malignancies frequently occur at a young age in those with XP. In fact, metastatic malignant melanoma and squamous cell carcinoma are the two most common causes of death in XP victims. This is a very rare disease. The incidence differs regionally and is between 1:40000 (Japan) and 1:250000 (USA). About 250 XP patients live in the USA, about 50 in Germany, mostly children. The life expectancy is low; usually they die in the first decade. If left unchecked, damage caused by UV light can cause mutations in individual cells DNA. XP patients are at a high risk (more than 2000 times over the general population) for developing skin cancers, such as basal cell carcinoma, for this reason. A report on the successful using NSC-631570 in a XP patient suggests this drug can be very useful also in this hereditary disease. NSC-631570 bei Xeroderma pigmentosum: Patient S.S., an eight year old boy, was presented with an ulcerating lesion of the nose. As he was 10 month old, xeroderma pigmentosum was diagnosed. Until the age of three years the number of skin lesions increased considerably. In May 2002 skin cancer (squamous cell carcinoma) at the nose was diagnosed, T4NXM0, histologically verified. From May till June 2002 three cycles of chemotherapy were administered (cyclophosphamide, vincristine, and vinblastine). The therapy failed and the tumors grew up. Clinical investigation in April 2004 revealed deforming malignant melanoma of the nose with invasion into the cartilage of nasal septum, measuring 3x3 cm. On 20 May 2004 the therapy with Ukrain was started, 5 mg intravenously twice a week, up to a total dose of 85 mg. One month after the last administration of Ukrain a complete regression of the tumor was revealed. The skin defect was partially replaced with connective tissue. Xeroderma skin lesions improved throughout the body.

Biography

Wassil Nowicky — Dipl. Ing., Dr. techn., DDDr. h. c., Director of "Nowicky Pharma" and President of the Ukrainian Anti-Cancer Institute (Vienna, Austria). Inventor of the anti-cancer preparation on the basis of celandine alkaloids "NSC-631570". He is an author of over 300 scientific articles dedicated to cancer research. Dr. Wassil Nowicky is a real member of the New York Academy of Sciences, member of the European Union for applied immunology and of the American Association for scientific progress, honorary doctor of the Janka Kupala University in Hrodno, doctor "honoris causa" of the Open international university on complex medicine in Colombo, honorary member of the Austrian Society of a name of Albert Schweizer. He has received the award for merits of National guild of pharmacists of America. the award of Austrian Society of sanitary, hygiene and public health services and others.
