Myocardial Infarction without Arterial Obstruction in Patient Post COVID 19 Treatment**Huang Wei Ling**

Brazil

Introduction: Some risks factors associated with COVID 19 infections were established such as coronary artery disease in patients with SARS-CoV-2 infections. The use of highly concentrated medications according to Arndt Shultz Law can induce reduction in the vital energy, leading to stagnation of Blood and propensity to have myocardial infarction even without arterial obstruction. Purpose; to demonstrate that patient with COVID 19 infection that received highly concentrated medications to treat this infection, have more propensity to develop myocardial infarction some days after the treatment instituted. Methods; through one case report of 42 years-old patient with history of acquired COVID 19 on January 2nd 2021, he was admitted in the hospital due to dyspnea symptoms, myalgia, and needs oxygenation. He received the medications, ivermectine, hydroxycloquine, corticosteroids. After 18 days of the initial manifestations, the patient felt pain in the chest and went to the hospital and they found that his troponin were increasing gradually and after two hours of it increased many times and the physician decided to admit him again in the hospital to make more exams. The patient was submitted to catheterization and the result of this procedure were that all his coronary were in perfect state of health without any obstruction and they treated him as he had myocardial infarction. After three months, the patient went to the author's clinic to evaluate his condition and she did chakras' energy centers measurement. Results: the results of this condition that revealed that all his chakras' were in the lowest level of energy with exception of the seventh that was normal. The author began his treatment with the use of homeopathic medications according to the theory Constitutional Homeopathy of the Five Elements based on Traditional Chinese Medicine. Conclusion; the conclusion of this study is that patients when treated with highly concentrated medications to treat SARS-CoV-2 infection can develop myocardial infarction without arterial obstruction due to energy deficiency state that aggravated many times due to the use of highly concentrated medications used to treat this kind of infection nowadays.

Biography:

Huang Wei Ling, born in Taiwan, raised and graduated in medicine in Brazil, specialist in infectious and parasitic diseases, a General Practitioner and Parenteral and Enteral Medical Nutrition Therapist. Once in charge of the Hospital Infection Control Service of the City of Franca's General Hospital, she was responsible for the control of all prescribed antimicrobial medication and received an award for the best paper presented at the Brazilian Hospital Infection Control Congress in 1998.
