## Mysterious acute bilateral ptosis

**Ghada Yousry Sayed**

Eye Subspecialty Center, Egypt

A 4-year-old boy was presented to the clinic by acute onset bilateral ptosis. He was examined for mechanical causes (no abnormalities were detected in lids), definitely not congenital (acute onset is against us) and he was investigated for the systemic and local myogenic causes, neurogenic and neuromuscular junction causes (anticholinesterase antibodies negative, anti-musk antibodies negative) of ptosis and all revealed no abnormalities. The picture then converted to unilateral hypertropia which improved on its own and followed by huge exotropia. A full pediatric dose of Mestinon was given and side effects occurred, then a gradually increasing pediatric dose was started and clinical picture improved greatly.

## Biography

Ghada Yousry Sayed has completed her Master's degree from Ain Shams University, Egypt. She is a Member of International and European Strabismological Associations (ISA and ESA) and an active Member of the Egyptian Pediatric Eye Surgeons (EGPES). She is the Head of Pediatric Ophthalmology and Strabismus in Safer Eye Center. She has assisted in scientific research including data gathering and writing in national and international papers.
