Needle track technique in strabismus surgery

Seema Dutt Bandhu

Manipal Tata Medical College, India

Introduction: Scleral perforation during the passage of suture needle is a known complication of strabismus surgery. In order to ease the passage of the suture needle through the sclera during <u>strabismus</u> surgery, a tunnel was created through the sclera with a 26-gauge needle.

Material and Methods: After taking clearance from the Institutional Ethics Committee, an interventional study was carried out on twenty patients. The scleral tunnel technique was performed on the patients of strabismus after taking written informed consent. Before passing the suture needle through the sclera during strabismus surgery, a 3-4 mm long tunnel through approximately half the thickness of the sclera was created with the help of a bent 26-gauge needle. The suture needle was then passed through this tunnel. Rest of the steps of the surgery was carried out in the conventional manner. In a control group of same number of patients, the surgery was performed in the conventional method. Both the groups were followed up for any complications. Ease of passing suture and surgeons' satisfaction with the technique was noted on a 10-point Likert scale.

Results: None of the patients in either group suffered from any complications.

Four surgeons participated in the study. The average Likert scale score of the surgeons for satisfaction with the technique was 4.5 on a scale of 5. The score for ease of passage of suture needle was 5 on a score of 5.

Discussions: Scleral perforation during passing the sutures through the sclera is a known complication of strabismus surgery. Incidence reported is 7.8% it occurs due to inappropriate engagement of the scleral tissue or passage of the suture needle along a wrong axis during the process of passing the suture needle. The needle track technique eases the passage of passing the suture needle through the sclera. The surgeons have reported that they are highly satisfied with the technique; they have reported that the technique eased the passage of the suture needle through the sclera.

Biography

Seema Dutt Bandhu has done MBBS, MS and currently working as Professor in Department of Opthalmology, Manipal-TATA Medical College, Jamshedpur, Jharkhand, India.
