EDITORIAL

Anti-oxidative natural drugs with proof based valuable effects in the treatment of diabetes can be utilized as an adjuvant treatment to the ordinary treatment of diabetic COVID-19 patients, as indicated by analysts in Tehran. The specialists, has noticed that better planned experimental and clinical examinations are urgently needed to affirm their useful impacts. Anti-oxidative herbal medications can be utilized as adjuvant to at present endorsed medications to treat COVID in patients with diabetes and furthermore can be considered as an appropriate source to recognize novel restorative specialists for COVID-19.

One of the scientist said that “Certain spices fill in as anti-oxidants and check free radicals separated from keeping up ordinary blood glucose levels”.

He also suggested that against diabetic natural formulation, BGR-34, created utilizing extracts of spices like Giloy, Vijaysar, Daruharidra, Gudmar, Methika and Majeeth.

BGR-34, industrially manufactured by Aimil Pharmaceuticals, has shown therapeutic efficacy for treating recently diagnosed type 2 diabetes, as found in free clinical preliminaries test.

As the world notices November 14 as Diabetes Day, scientists said that herbal ingredients like Giloy utilized in BGR-34 additionally rectifies insusceptibility, while compounds in Dharuharidra help in insulin discharge in type 2 diabetic patients.

For a treatment to be suggested as adjuvant treatment for respiratory infections with regards to COVID-19, we here discover that the treatment is compelling and that its normal advantages exceed its likely dangers to patients. Briefly, this evaluation is educated by the assemblage of proof about every treatment's safety and viability

recovered in a writing search. This evaluation is additionally educated by various different elements, including the seriousness of the hidden condition and how well patients' clinical necessities are tended to by presently accessible treatments. The decision also reflects current relevant laws, guidelines, and medical services recommendations, contemplating the vulnerability related with COVID-19.

Precaution and therapeutic approaches

Due to the development of the spread of the sickness, health systems have become over-burden, in any event, having adequate indicative limit and medical clinic facilities to deal with such an episode. In the most vulnerable regions, the COVID-19 scourge adequately incapacitates well-being frameworks to the detriment of primary health care. A few measures, for example, lock-down of communities, social distancing, and isolate type for those suspected to be infected can, atleast in part, moderate the COVID-19 spread and, empower the health systems to adapt. These actions are palliative, and people tend to ignore them after a few days of isolation, mainly those in disadvantaged and vulnerable communities.

Critically, at this stage, we are beginning to develop an evidence base for the best system to treat, moderate, and prevent the illnesses. At present, none of the methodologies utilized is evidence based.

In the worldwide search for a reaction to the COVID-19 pandemic, news about "alternative cures against COVID" have been dispersed. As of July 2020, the evidence base for such medicines is frequently restricted if not non-existent. However, regularly solid, unconfirmed cases are made about the advantages and disadvantages of natural medicines, which will also result both in false hopes or strong fears of those at risk or ill with COVID-19.
