

Dangerous and Devasting- A case series of Endogenous klebseilla Endophthalmitis

Nur syarafina Binti abdul malek

Department of ophthalmology, Tengku ampuan rahimah, Klang

Abstract:

To explore the impact of the head nurse's managerial competences (HNMC) on the occupational burn-out of staff. Occupational burn-out was considered as an essential factor contributing to the staff's leaving. However, little is known about the impact of HNMC on the occupational burn-out of staff. A cross-sectional survey conducted in a teaching hospital in central Taiwan which has 603 nurses. Questionnaires inquiring perceived HNMC, personal burn-out (PBO) and work related burn-out (WBO) were filled out in a network form. Results : The respondents included 25 head nurses and 484 nurses. It was observed that 7 and 2 out of the 9 dimensions of HNMC respectively were significantly correlated with PBO and WBO scores in mild burn-out group
