

**Genetics Confounding the Diagnosis of Glaucoma or Myopia**

Atanu Majumdar

Kuang Tien General Hospital, Hung Kuang University

**Abstract:**

Any practitioner managing glaucoma would have faced the challenge of diagnosing and treating high myopes who resembles glaucomatous but don't have raised IOP. Several studies like Blue Mountain Eye Study, the Beijing Eye Study have confirmed that myopes are more likely to have glaucoma. Attempt to set guideline with an aim to segregate patients having high myopia with glaucoma from patients having only high myopia. Certainly cross sectional diagnosis for glaucoma would be tricky, particularly with myopic nerves, hence every possibility that some myopes are misdiagnosed as having glaucoma.

**Biography:**

Dr. Atanu Majumdar is currently pursuing his PhD at the age of 39 years from NIMS University Rajasthan, Jaipur. He is the reviewer of International Ophthalmology and with many other live memberships he is also a member of ESCRS (European Society Of Cataract Surgeons).
