RECONSTRUCTIVE UROLOGY

Reconstructive urology is surgery to re-establish typical capacity by fixing, rerouting, or reproducing spaces of the upper and lower urinary tract and some conceptive organs. Patients may require reconstructive urology in view of wounds, birth defects, medical conditions, or complications from surgery or other treatment.

Rehearsing in one of the country's leading clinical and research facilities, our urologists (experts in the urinary tract) are perceived as global specialists in reconstructive urology. UT Southwestern urologists were the first in North Texas to utilize the most current age careful robot, the double reassure DaVinci Surgical System, which empowers us to do insignificantly obtrusive medical procedures with much more noteworthy accuracy.

Male reconstructive urology (additionally called male genitourinary recreation) can be utilized to treat actual irregularities, fix injury identified with significant surgery or mishaps, or deal with certain bladder control issues like incontinence and OAB. Beaumont is at the bleeding edge of urological surgery, offering far reaching administrations and projects to assist patients with various reconstructive requirements.

EXPLANATIONS BEHIND RECONSTRUCTIVE PROCEDURES

Your PCP may have various purposes behind performing male reconstructive urological strategies to address complexities because of infection, injury or significant operations.

Urethral strictures

Solidified tissue in the urethra that can hinder pee stream are called urethral injuries. Men are infrequently brought into the world with urethral injuries, which create after some time because of disease or operations including the urethra. They might be brought about by aggravation or scar tissue from surgery, urinary lot diseases, injury or rehashed catheterization. Urethral injuries may likewise be brought about by pressure from a developing tumor close to the urethra, albeit this is uncommon.

Confusions following a prostatectomy

The essential objective of a prostatectomy is to eliminate all the

malignant tissue and however the surgery is genuinely standard, it is as yet significant surgery, regardless of whether done mechanically. Extra methodology and medicines can assist you with recuperating utilization of sexual and urinary capacity should intricacies emerge. Erectile brokenness and incontinence are normal conditions following prostate surgery and can be revised utilizing reconstructive strategies.

Outside trauma

Injury to the urethra, prostate and bladder are regularly the aftereffect of significant wounds to the pelvis or from obtuse power injury and can expect surgery to fix harm, realign the urinary lot or eliminate scar tissue post-care. Basic wounds incorporate harm to the bladder, tears or extreme aggravation of the prostate or blockages of the urethra.

Incontinence

Surgery can be utilized to treat instances of flood incontinence and stress incontinence by either reshaping the urethra, supporting the urethra or adding nerve incitement to help with bladder control. Surgery to address incontinence following a prostatectomy is normal.

Urethral reconstructive surgery

- Urethroplasty
- Mitrofanoff Procedure
- Ileal Conduit Formation
- Ileal Neobladder
- Indiana Pouch
- Ureteral Reimplantation

Pediatric reconstructive surgery

Hypospadias Repair: surgery used to address a birth deformity wherein the urethra doesn't end at the tip of the penis, yet rather on the underside, center, or lower part of the penis, or in more extreme cases, in or behind the scrotum.
