

The utility model relates to an infusion bottle hook used in hospital bathroom

Yaping Bai

Xiamen Cardiovascular Hospital Xiamen University, China

Abstract

Purpose: To design a hook for transfusion patients.

Method: The hook includes a bottom plate, one side is used for fixed connection with a wall or door, and the other side is provided with a vertical slide groove. The slider is slidingly arranged on the vertical chute, and the slider is provided with a threaded through hole corresponding to the groove position of the vertical chute. The spiral long rod includes a fastening section, a threaded section, and a long rod section from left to right, and the threaded section is used to cooperate with the threaded through hole so that the fastening section is closely or away from the vertical towards the bottom of the chute. The hook is arranged on the spiral long rod and is located on the side of the long rod section far from the threaded section, which is convenient for patients to hang the infusion bottle when they go to the bathroom.

Results: The hook is convenient for patients to hang the infusion bottle, and it can freely adjust the height of the hook position according to their height or action needs, so that the infusion bottle hangs at an appropriate height.

Conclusions: The hook solves the problem of placing an infusion bottle when a transfusion patient goes to the bathroom, and can freely adjust the height, which is worth popularizing and applying.
