

## Types of Alcoholic Liver Transplantation

Anil T. Patil\*

Department of Pedodontics and Preventive Dentistry, Bharati Vidyapeeth Deemed University Dental College and Hospital, Sangli, Maharashtra, India.

### EDITORIAL NOTE

Injury to liver cells and responsive fibrosis of the mesenchyme may happen after a couple of long stretches of unreasonable ethanol intake or after any longer range, now and then even many years. We have been especially intrigued by the beginning phases of liver injury and in the movement or monotonous character of the pathologic sores that lead to conspicuous alcoholic liver illness. Multitudinous articles have been composed on the pathology of liver injury in the heavy drinker, yet these have been worried about biopsies taken from patients with suggestive liver illness or they have been retrospective studies based upon autopsy findings. Chronic Hypertension.

### Alcoholic fatty liver

The first and most basic sort of ALD is alcoholic fatty liver. While this is the most un-extreme type of ALD, influencing 20% of heavy consumers, it actually can cause risky results. Liquor fatty liver is a quiet illness with few or no symptoms, damage to the liver is as still occurring. On the off chance that liquor utilization is stopped or altogether reduced, the sickness can be turned around. Alcoholic fatty liver can lead alcoholic hepatitis.

### Alcoholic hepatitis

- Alcoholic hepatitis is much more serious and can be harder to control. People diagnosed with alcoholic hepatitis may experience the following symptoms:
- Swollen liver
- Nausea
- Abdominal pain
- Vomiting

### Alcoholic cirrhosis

The most extreme kind of ALD is alcoholic cirrhosis which happens when scar tissue harms the liver and keeps it from working appropriately.

- Redness of the palms of their hands
- Thickening of the fingers
- Liver extension and inflammation

- strange development of fat in ordinary liver cells
- shortening of muscles in the fingers

### SYMPTOMS

- Digestive Symptoms Include:
- Dry mouth and increased thirst
- Nausea and vomiting

### Skin problem such as

- Itching
- Redness on the feet or hands
- Red spider like veins on the skin

### Brain and nervous system symptoms includes

- Number of feet and legs
- Light headiness
- Problem with thinking and memory

### Stages of damage

- Healthy Liver
- Fatty Liver
- Liver Fibrosis
- Cirrhosis

### DIAGNOSIS

#### Liver function tests

These are simple, inexpensive and easy to perform but can't be utilized in alone to make diagnosis which incorporate;

Serum egg whites levels and prothrombin time shows hepatic protein combination,

Bilirubin is a marker of entire liver capacity, transaminase levels indicates hepatocellular injury and death Basic phosphatase levels estimate the impedance of bile flow

#### Imaging tests

Can be used to assess for hepatic parenchymal changes

MRI or CT scan can be used to diagnose fatty change or neoplastic disease of the liver. Ultrasound scan can also diagnose the fatty changes in liver.

### **Liver biopsy**

It may be indicated in any patient with serum aminotransferases elevated that persist for 6 months.

who have the evidence of liver failure in addition to elevated aminotransferases. Patients in whom the diagnosis of alcoholic hepatitis is uncertain based upon clinical and laboratory findings.

### **Endoscopy**

An endoscope is a thin long flexible tube with a light and video camera at one end. This tube is passed into the oesophagus and stomach and used to study for varices.

### **TREATMENT**

- Abstinence
- Nutrition
- Drug therapy
- Liver transplantation
