

## *Adaptative metabolism of lactic acid bacteria during brewers' spent grain fermentation*

Marta Acín Albiac

Free University of Bozen-Bolzano, Italy

### *Abstract*

**B**rewers' spent grain (BSG), the most abundant by-product generated in the beer-brewing process, represents an example of valuable raw material and source of health promoting compounds. To the date, the valorization of BSG as a food ingredient has been limited due to poor technological and sensory properties. Tailored bioprocessing through lactic acid bacteria (LAB) fermentation is a versatile and sustainable mean for the exploitation of food industry by-products. Indigestible carbohydrates and high phenolic content make of BSG a hostile environment for microbial survival. Our study investigated the metabolic strategies of *Leuconostoc pseudomesenteroides* and *Lactobacillus plantarum* strains to exploit BSG as a food ingredient. Two distinctive BSG samples from different breweries (Italian IT- and Finish FL-BSG) were microbially and chemically characterized. Growth kinetics, organic acid profiles and the evolution of phenolic profiles during the fermentation in two BSG model media were determined. The results were further complemented with gene expression targeting genes involved in the degradation of cellulose, hemicelluloses building blocks and the metabolism of anti-nutritional factors. Overall, the results were LAB genus dependent showing distinctive metabolic capabilities. *Leuc. pseudomesenteroides* DSM 20193 may degrade BSG xylans while sucrose metabolism could be furtherly exploited for EPS production to enhance BSG pro-technological properties. Although *L. plantarum* strains may follow the same metabolic strategies during BSG fermentation, the mode of action to pursue such strategies was strain dependent. Phenolic compounds profiling highlighted a novel metabolic route for lignin metabolism. These findings will allow an improvement of understanding of how LAB transform BSG into economically valuable food ingredients.

### *Biography:*

Marta Acín-Albiac got her Bsc. in Food Science at University of Barcelona (UB) and she got specialized during her Msc. in Bioengineering at Sarrià Chemical Institute (IQS-URL, Spain). Currently, she is pursuing her PhD in Food Engineering and Biotechnology at the Free University of Bolzano (UNIBZ) under Prof. Di Cagno supervision. Her main research focus is on the improvement of fermentation strategies based on lactic acid bacteria metabolism to increase nutritional features of foods and to valorize food by-products.
