According to Feinman and Einstein I consider Science as a truth or a collection of (visual) images developing in space and time that are connected by symbols, generally words. About the same object, people show a cross-sectional variability in their mental reproductions and even the same person shows a longitudinal variability. These mental developments allow prediction of the next events, e.g. what we shall find around the corner. The variability is high in the correspondence of the predicted events versus the actual events. The coincidence degree represents the value of a given “truth” and the reliability of a person. Many physicians may assert a prognosis from the current state of an ill patient, from personal experience and science. I presume to know the expectations patients wishful unaware to recognize. For physicians, the patient requires more and more insulin to allocate energy in increasing fatty stores. Insulin is given sometimes directly by injections or indirectly by drugs stimulating production. A project for a never ending body weight increase! Why am I blaming Physicians have to share the help of physicians. The patient requires more and more insulin to allocate energy in increasing fatty stores. Insulin is given sometimes directly by injections or indirectly by drugs stimulating production. A project for a never ending body weight increase! Why am I blaming
