Abstract

Ofloxacin is used to treat a bacterial infection. It is indicated for the treatment of adults with mild to moderate infections triggered by susceptible strains of the nominated microorganisms in the infections like acute bacterial exacerbations of chronic bronchitis, community acquired pneumonia, uncomplicated skin and skin structure infections, acute, uncomplicated urethral and cervical gonorrhoea, nongonococcal urethritis and cervicitis, mixed infections of the urethra and cervix, acute pelvic inflammatory disease (including severe infection), uncomplicated cystitis, complicated urinary tract infections and prostatitis. The most common side-effects are feeling sick, diarrhea, feeling dizzy and headache. Spectrophotometry is regarded as by its speed and simplicity, accuracy and inexpensive instrument needed, and hence it is a significant substitute to further analytical methods, through clear advantages in terms of cost of analysis. Assay of Ofloxacin tablets is carried out by a rapid, simple, accurate, and economical least time consuming spectrophotometric method and then compares it with the assay of two different brands available in Karachi, Pakistan. Results of assay reveal that both trademarks of Ofloxacin are bioequivalent and are within the endorsed range. Brand A shows a percent assay of 100% while Brand B shows low value for percentage assay that is 96.31%.

Keywords: Ofloxacin; Infections; Susceptible strains; Spectrophotometric; Assay

Introduction

Fluoroquinolones are bactericidal in activity, act on subunit A of DNA gyrase (bacterial topoisomerase), and an enzyme that introduces negative super-twists into DNA and separates interlocked DNA molecules [1]. This leads to interference with DNA replication, segregation of bacterial chromosomes, transcription, and other cellular processes. Bacterial resistance to the newer fluoroquinolones occurs less frequently than to the older analogue, nalidixic acid [2]. Fluoroquinolones are highly effective against Gram positive and Gram negative bacteria both *in vivo* and *in vitro* with few of the problems of their predecessors [3]. The spectra of activity of the fluoroquinolones against these organisms appear comparable; however, differences emerge against other microorganisms, such as Chlamydia trachomatis, Mycobacterium species and *Mycoplasma pneumoniae* [4]. Ofloxacin is a synthetic chemotherapeutic antibiotic of the fluoroquinolone drug class considered to be a second-generation fluoroquinolones [5,6], with a broad spectrum of activity against gram-positive and gram-negative bacteria [7] with poor activity against anaerobes (4). Its chemical (IUPAC) name is (RS)-7-fluoro- 2-methyl- 6-(4-methylpiperazin-1-yl)- 10-oxo-4-oxa-1-azatricyclo[7.3.1.0^{5,13}]trideca-5(13),6,8,11-tetraene-11-carboxylic acid (Figure 1) [8]. It is a bactericidal and DNA gyrase inhibitor widely prescribed in acute and chronic lower respiratory tract infections and infections of ear and nose [9]. It functions by inhibiting DNA gyrase, a type II topoisomerase, and topoisomerase IV [10]. It is indicated for the treatment of adults with mild to moderate infections triggered by susceptible strains of the designated microorganisms in the infections like acute uncomplicated cystitis, bronchitis, chronic prostatitis, complicated UTIs, corneal ulcers, diabetic foot ulcer, GI infections, lower RTIs, meningococcal infections, ophthalmic infections, otitis externa, otitis media, pelvic inflammatory disease, pneumonia, prostatitis, pulmonary infection, septicaemia, sexually transmitted infections, skin and soft tissue infections, travelers diarrhoea, uncomplicated genital chlamydial infection, non-gonococcal urethritis, urinary tract infection, and can

also be given in adjunctive therapy as an alternative drug of choice in conjunctivitis, osteomyelitis, skin infections, soft tissue infections. Oral absorption of Ofloxacin is found to be 100%. Volume of distribution is found to be 1-2.5 L/kg and plasma protein binding is 20-25% and metabolism is reported hepatic. Renal Excretion accounts for 80% and plasma half-life is 4.9 h-6.9 h. The severe adverse effects of Ofloxacin include Sinus tachycardia, Hallucinations, Stevens johnson syndrome, Stevens johnson syndrome, Seizures, Tendon rupture. Ofloxacin is also considered to be contraindicated within the pediatric population, pregnancy, nursing mothers, and patients with psychiatric illnesses and in patients with epilepsy or other seizure disorders. Spectrophotometry is characterized by its speed

and simplicity, accuracy and inexpensive instrument needed, and hence it is an important alternative to other analytical methods, with clear advantages in terms of cost of analysis. A simple and sensitive spectrophotometric method for the determination of Ofloxacin (OFX) in pharmaceuticals is the measurement of absorbance of OFX in 0.1 M HCl at 293 nm [11]. Our research group has performed comparative analysis of different brands available in the market which is very useful for health professionals [12-20].

Experimental

Assay

For the measurement of spectra UV visible 1601 Shimadzu double beam spectrophotometer was used. 0.1 M HCl was used as solvent.

Material and reagents

Pyrex glass wares were used which includes measuring cylinder, volumetric flask and pipette, mortar and pestle, weighing machine. For initially washing of glass wares we use chromic acid afterward we use water and finally rinsed with double distilled water (freshly prepared) and the tablets of different brands of Ofloxacin.

Wavelength selection

10 mcg solutions were prepared accurately and which was scanned between 200 nm - 400 nm wavelength region. Maximum absorption was observed at 293 nm which was taken as lamda max.

Standard stock solution

100 ml solution was prepared by dissolving 10 mg of Ofloxacin and absorbance was taken at its lamda-max after making its 10 mcg dilution.

Sample preparation

From different medical store located in Karachi, two brands were purchased. Each brand was drawn from one marketed batch and contained 200 mg per tablet.

Each brand was given a serial number for identification and average weight of tablet was taken and powder containing 200 mg of Ofloxacin was drawn from each brand and transferred in 50 ml of water and dissolved. After dissolving drug volume was makeup to 200 ml with water. Absorbance was taken at its lamda-max after making its 10 mcg dilution.

Procedure

By preparing standard and sample solution having strength of 10mcg were made. Absorbance was taken by using 1cm cell at maximum wavelength 293 nm. By applying formula quantity of Ofloxacin (mg) present in each unit dosage form was calculated.

Drug	Brands	Manufacturer	Average weight of tablets (gm)	Absorbance at 293 nm	
				Sample	Standard
Drug A	Arloxin	Pakistan PP	0.49428	0.980	0.980
Drug B	Ofloshine	Sunshine P	0.34485	0.941	0.977

Table 1: Absorbance of different brands of Ofloxacin.

Brands	Percentage of assay
Drug A	100%
Drug B	96.31%

Table 2: Percentage assay of different brands of Ofloxacin.

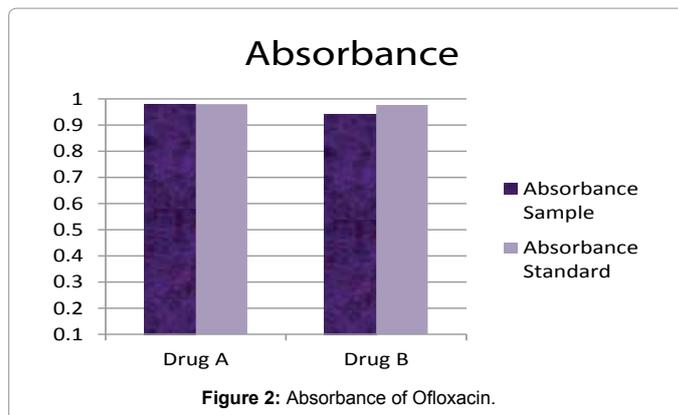

Figure 2: Absorbance of Ofloxacin.

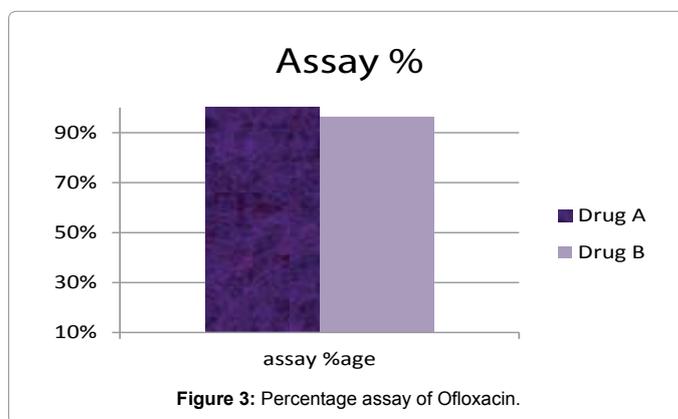

Figure 3: Percentage assay of Ofloxacin.

Result and Discussion

The aim of the study was to carry out the pharmaceutical assay on two different brands of Ofloxacin (200 mg) tablets. Results are given in Tables 1 and 2, both the drugs shows results within the range. Pharmaceutical assay of Ofloxacin was carried out on different brands using spectrophotometer Figures 2 and 3. Table 1 shows brand name, manufacturer, average weight and absorbance of 10mcg solution in 0.1M HCl at 293nm against the solvent blank. % assay of different brands is shown in Table 2. This proposed method for assay of commercially available Ofloxacin tablet formulation is very simple, economical, accurate, least time consuming and rapid. It can be used for routine QC quality control analysis in the API, and tablet formulation. Our results reveal that both brands of Ofloxacin are bioequivalent and are within the official range. Arloxin shows a percent assay of 100% while Ofloshine shows low value for percentage assay that is 96.31%.

Conclusion

It is concluded that both available brands are equivalent as having % assay approximately equal hence can be used for the treatment of bacterial infection.
