

## Hair Restoration and Techniques

Susan Farshi\*

Department of Dermatology, Tehran University of Medical Sciences, Tehran, Iran

### DESCRIPTION

Hair transplantation may be a surgical technique that removes hair follicles from one part of the body, referred to as the 'donor site', to a bald or hairless part of the body called the 'recipient site'. The technique is primarily accustomed to treat male pattern depilation. During this minimally invasive procedure, grafts containing hair follicles that are genetically immune to hair loss (like the rear of the head) are transplanted to the bald scalp. Hair transplantation may also be accustomed to restore eyelashes, eyebrows, beard hair, chest hair, crotch hair and to fill in scars caused by accidents or surgery like face-lifts and former hair transplants. Hair transplantation differs from skin graft in that grafts contain most of the cuticle and corium encompassing the follicle, and plenty of little grafts are transplanted instead of one strip of skin. Since hair naturally grows in groupings of one to four hairs, current techniques harvest and transplant hair "follicular units" in their natural groupings. So trendy hair transplantation can do a natural look by mimicking original hair orientation. This hair transplant procedure is named cyst unit transplantation (FUT). Donor hair is harvested in 2 different ways: strip harvest, and cyst unit extraction (FUE). There are many sorts in hair transplantation. They include:

- Pre-operative assessment and designing
- Harvesting strategies
- Strip gathering
- Follicular unit extraction (FUE)
- Follicular unit transplant
- Robotic hair restoration
- Androgenetic baldness surgery

- Eyebrow transplant surgery
- Frontal hair line lowering or reconstruction surgery

It is my nice honor to function as a piece of writing member for the Journal "Hair medical aid & Transplantation". I'm grateful to the Editorial assistants of the Journal World Health Organization thought about American state as an appropriate Editor supported my publication works and interests. Within the previous year, HTT noninheritable twenty papers, from that nine articles were rejected within the preliminary quality take a look at as they're plagiaristic with high proportion. Around eleven articles were sent to the reviewers for more peer-review method, during which nine articles have been accepted by the Editor and reviewer. In 2019, the Journal has revealed its ninth volume with one issue (Being yearly), during which accepted articles were revealed on-line among time. The written versions of the articles were sent to the authors World Health Organization requested for it and were sent among thirty days of commercial enterprise the difficulty on-line. A complete of eighty-four analysis scientists from everywhere the globe reviewed articles revealed in Volume nine. The typical publication time of a piece was calculable to be forty-two days.

I would conjointly prefer to add the objectives of the articles that require to be revealed within the coming 2020 issue.

I convey all the trichologists and researchers WHO are fighting their life to treat the pandemic hair diseases and every one medical advisors, writers for creating the experimental demonstration into a paper. I appreciate all the Editors and reviewers of the Journal WHO has stepped up and created the journal successful. I hope this support are going to be continued by all of them and maintain the quality of the Journal.
