

Figure S1 Map showing the location of sediment core sample collected in Osaka Bay, Japan.

Figure S2 Establishing CRS model.

Establishing CRS model

An age of a given sample mass depth is calculated based on $^{210}\text{Pb}_{\text{excess}}$ inventory which is obtained by numerical integration of the radioactivity of $^{210}\text{Pb}_{\text{excess}}$ versus mass depth profile (Appleby, 2001). If m denotes the mass depth (g cm^{-2}) of the sediment layer of age t and $C(m)$ is the radioactivity of $^{210}\text{Pb}_{\text{excess}}$ (Bq g^{-1}) at the depth m , $^{210}\text{Pb}_{\text{excess}}$ inventories below m_i and the total inventories can be calculated using the formulae

$$A = \int_{m_i}^{\infty} C(m) dm, \quad (1)$$

and

$$A(0) = \int_0^{\infty} C(m) dm, \quad (2)$$

respectively. From their values, the age of sediments of depth m_i is calculated using the formula

$$t = 1/\lambda \ln (A(0)/A). \quad (3)$$

Accumulation rate (r) at a given sample mass depth is determined from the equation (Appleby, 2001)

$$r = \lambda A/C(m). \quad (4)$$

To establish CRS model we calculate A from the following formula:

$$A = A(0) - \hat{A} \quad (5)$$

where \hat{A} denotes the cumulative inventory in sediments above the depth m . $A(0)$ is calculated from the following formula:

$$A(0) = \hat{A}_N + A_b \quad (6)$$

where \hat{A}_N denotes the cumulative inventory in sediments above the depth m_N , at which $^{210}\text{Pb}_{\text{excess}}$ value is close to the instrumental detection limit and A_b denotes the inventory in sediments beneath this depth.

A_b can be estimated using the formula

$$A_b = \lambda^{-1} r_b C_N, \quad (7)$$

where λ is the radioactivity decay constant of ^{210}Pb , r_b denotes the mass accumulation rate in sediments ($\text{g cm}^{-2} \text{ yr}^{-1}$) beneath the depth m_N , and C_N denotes the radioactivity of $^{210}\text{Pb}_{\text{excess}}$ at the depth m_N . r_b is estimated from the exponential regression line of the $C(m)$ against depth m in the lower levels above the depth m_N using the formula

$$r_b = -\lambda / \frac{d}{dm} \ln C(m). \quad (8)$$

An error of an age and a sediment mass accumulation rate was determined from the equation of Appleby (2001).

Calculation of POP-like characteristics of TIPPPs

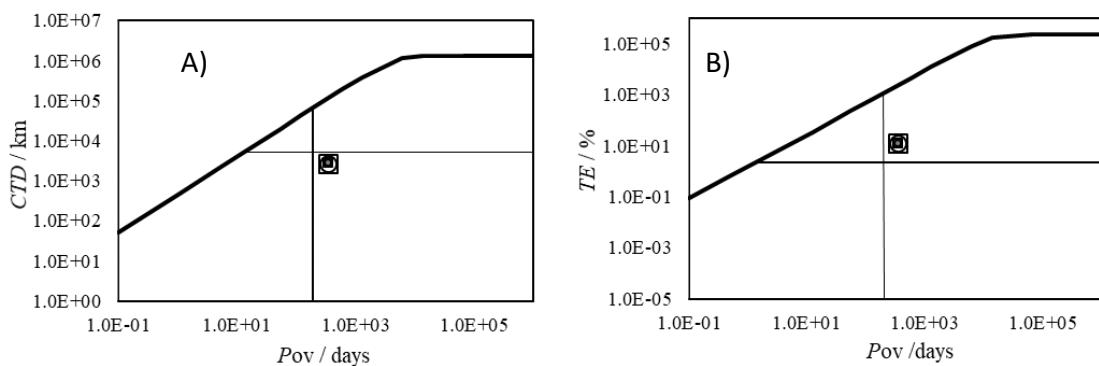

Figure S15 Overall persistence (P_{ov}) and long-range transport potentials (CTD: characteristic travel distance (A) and TE: transfer efficiency (B)) of TIPPPs calculated by the OECD P_{ov} and LRTP Screening Tool ver. 2.2. Square, tris(2-isopropylphenyl)phosphate; Circle, tris(3-isopropylephenyl)phosphate. White and gray keys denote partition coefficient data from EPI-Suite ver. 4.11 and UFZ-LSER Database, respectively. Vertical and horizontal lines denote POP criteria for P_{ov} and CTD or TE, respectively (Klasmeier et al., 2006). P_{ov} (days) is a measure of the time scale of degradation of the chemical in the whole environment. CTD (km) and TE (%) represents a transport-oriented metric and a target-oriented indicator, respectively. Details of these parameters are described in an earlier paper (Wegmann et al., 2009). The tool requires the three degradation half-lives in air, water, and soil, and also two partition coefficients such as 1-octanol/water partition coefficient (K_{ow}) and air/water partition coefficient (K_{aw}) for the chemical of interest. The half-lives were estimated using EPI-Suite ver. 4.11 (<https://www.epa.gov/tsca-screening-tools/epi-suitetm-estimation-program-interface>). The log K_{ow} and log K_{aw} values were estimated using EPI-suite ver. 4.11 and UFZ-LSER Database ([http://www.ufz.de/index.php?en=31698&contentonly=1&m=0&lserd_data\[mvc\]=Public/start](http://www.ufz.de/index.php?en=31698&contentonly=1&m=0&lserd_data[mvc]=Public/start)).

MW: Molecular weight

RT: Retention time

IDL: Instrumental detection limit (ng) with 1 μ L injection; S/N=3MDL: Method detection limit (μ g g⁻¹ dry wt): final volume 1000 μ L: soil sample 2.5 g.

Duong et al., 2019, Chemosphere, 219, 784-795

Table S4 Organic micropollutants registered in the CTA-AIQS (LC) database.

No.	Class 1	Class 2	Compound	CAS RN	Internal standard	Retention time, min	Formula	Log Pow	Adduct ion	Precursor mass	Fragment mass 1	Fragment mass 2	Lowest point of calibration curve, pg	Highest point of calibration curve, pg	Linearity of calibration curve, r^2	IDL (pg)	MDL (ng g ⁻¹ dry)

IDL: Instrumental detection limit (ng) with 1 μ L injection; S/N=3

MDL: Method detection limit (μ g g⁻¹ dry wt); final volume 1000 μ L; soil sample 2.5 g.

Table S5 GC-MS conditions for CTA-AIQS (GC).

GC-MS: Shimadzu GCMS-TQ8040

Column: J&W DB-5 ms (5% phenyl-95% methylsilicone) fused silica capillary column, 30 m X 0.25 mm i.d., 0.25 mm film

Temperature

Column: temperature programmed: 2 min at 40°C, 8°C/min to 310°C, 2 min at 310°C

Injector: 250°C

Transfer line: 300°C

Ion source: 200°C

Injection method: splitless, 1 min for purge-off time

Carrier gas: He

Linear velocity: 40 cm/s, constant flow mode

Ionization method: EI

Tuning method: target tuning for US EPA method 625

Measurement method: SIM/Scan mode; selected reaction monitoring [SRM] mode

Scan range: 45 amu to 600 amu

Scan rate: 0.3 s/scan
